1. Introduction

1.1 Purpose

This document describes the proposed user interface and user experience of the mock interview platform. It communicates how a candidate moves through the system from start to finish, the visual and interaction design principles behind the interface, and the specific screen designs that implement them. It is intended to guide frontend implementation and give a consistent reference point for design decisions as the product is built.

1.2 Target User

The primary user is a final-year engineering student preparing for placement interviews, typically practicing alone, often for the first time with a tool like this, and frequently under time pressure ahead of an actual interview. The design assumes the user is comfortable with ordinary web applications but has no prior experience with the product, so the interface must be self-explanatory without onboarding or a tutorial.

2. Design Goals and Principles

- **Calm over flashy** - the interface should feel like a serious, low-pressure practice space, not a gamified consumer app. Interview practice is already a mildly stressful activity; the UI should not add to that.
- **One thing at a time** - only the current question is visible during an interview; the candidate is never shown a list of upcoming questions, which would otherwise create anticipatory anxiety and encourage over-preparing answers rather than practicing to think on the spot.
- **Minimal, single-accent visual language one accent** - color used consistently for anything actionable or "live," so the interface never has to compete with itself for the user's attention.
- **Self-explanatory without instructions** - every screen should be usable on first encounter with no onboarding flow, given the target user is likely to use this tool once, under time pressure, shortly before a real interview.
- **Consistency across screens** - the same card style, spacing, and typography are reused for the interview screen and the results screen, so the results screen reads as a continuation of the same experience rather than a different product.

3. Screen Designs

The objectives mentioned below is not the final draft so it may or may not be changed.

NOTE : This is only a prototype for the documentation purpose not the actual design implementation itself.

3.1 Upload Screen

The first screen a candidate sees. A single, centered drag-and-drop zone with a clear file-type constraint (PDF, size limit) stated up front rather than discovered through a failed upload. The only action available is uploading a resume and pressing "Start interview" no navigation, no secondary options, minimizing any decision the candidate has to make before beginning.

3.2 Live Interview Session

The core screen, shown once per question. A monospace session label and question counter orient the candidate without cluttering the main content. A single card displays the current question, clearly labeled "INTERVIEWER" in the accent color, in a size and position that stays consistent for every question so the candidate's eyes don't have to re-find it each turn. Below the question, a minimal listening indicator (a small pulsing dot, a timer, a thin progress bar) shows recording is active without resorting to a busy animated waveform, keeping the tone calm rather than performative. The primary action ("hold to answer") is the single largest interactive element on the screen; a smaller, visually secondary "skip" button is available but deliberately de-emphasized.

3.3 Feedback Report Screen

Reuses the same card style as the interview screen - each question appears as its own card with the question text, a short excerpt of the transcribed answer, and a score badge in the accent color. Cards are stacked in a scrollable list rather than paginated, so the candidate can review the whole session in one continuous scroll. A single primary action ("Download full report") closes the loop, consistent with the one-primary-action pattern used on the other two screens.

4. Interaction Patterns

- Recording state is always visually distinct - the interview screen's listening indicator uses motion (a pulsing dot) specifically because it's the one state where the candidate needs an at-a-glance confirmation the system is working, without looking away from formulating their spoken answer.
- "Start interview," "hold Primary actions are always the widest, most visually dominant element on their screen to answer," and "Download full report" are each the only accent-colored (filled) button on their respective screen, so there is never ambiguity about what the main next step is.
- Secondary actions (skip) are visually quieter - outlined or muted rather than filled so a candidate under time pressure doesn't accidentally trigger them instead of the primary action.
- No question list or progress breakdown is shown beyond a simple counter ("Q3/8") - deliberately limiting information density to reduce anticipatory anxiety, consistent with the "one thing at a time" design goal in Section 2.

5. Conclusion

The interface design prioritizes calm, focus, and self-explanatory interaction over visual novelty, reflecting the reality that this tool is used alone, often under time pressure, by someone practicing a stressful task. The consistent dark theme, single accent color, and one-primary-action-per-screen pattern are all in direct service of that goal, and the three core screens documented here are designed to extend cleanly as future features (adaptive follow-up questions, multi-language support) are added, without requiring a visual redesign.
